EXAMINER'S ACTION

1. The following is a quotation of the first paragraph of 35 U.S.C. § 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

The specification is objected to under 35 U.S.C. § 112, first paragraph, as failing to provide an enabling disclosure. On page 3, second paragraph, the applicant has disclosed that the electronic audio signal will normally include a wide range of audio frequencies. The respective input levels are adjusted at potentiometer 74 so that the input signal levels of the two channels are about equal and to allow input amplifiers 78 to amplify the input signals to the maximum extent possible without clipping or otherwise adversely distorting the input signals. The audio signals are then enhanced through energy transfer system 54 and the enhanced signals adjusted in level by respective potentiometer 96 and for the desired flat frequency response by respective potentiometer 112 which can also be used to alter the shaping networks 109 somewhat to adjust the tonal quality as desired for the listener. Therefore, it is unclear to the examiner how can the enhanced audio signal be nonlinear with frequencies increased in amplitude as per increased in frequencies from a reference frequency toward its high end, over at least a portion of its frequency bandwidth, to a high frequency peak as claimed.

See above.
